ABOUT ME

Full-stack engineer with 7+ years of building the whole thing: the screens people click through, the APIs behind them, and the database underneath. Most of my work has been on products where the data has to be right the first time and where the people using it are not engineers, so login, accounts, permissions, dashboards, invoicing and payments are familiar ground. TypeScript end to end (React, Next.js, Node.js, NestJS) on PostgreSQL. AWS certified. I use Claude every day as part of how I plan and ship. I work remotely and I am one hour behind Singapore time.

WHAT I AM GOOD AT

React & Next.js

TypeScript, front to back

Node.js / NestJS APIs

PostgreSQL & data you can trust

Login, accounts & permissions

Dashboards for non-technical users

Invoicing & payment flows

AI coding agents, daily

AWS & CI/CD

Comfortable in messy codebases

WHERE I HAVE WORKED

Nespay / PT Webtiga Teknologi Utama Apr 2025 - Jul 2026

Software Developer

A payments platform for businesses. Flat team of 7, reporting to the CTO.

- Built the product end to end in TypeScript: the React and Next.js dashboard that admins and customers actually use, and the NestJS services behind it. Owning both sides meant no waiting on someone else to change an API.
- Set up how the application is put together, plus AWS access and the deployment pipeline (GitHub Actions on EC2). Splitting the pipeline into parallel jobs took deploys from 15 minutes down to 8.
- Looked after the parts where being wrong costs real money: invoicing, assigning each invoice to the right wallet, and moving balances through to settlement. Fixed a race where two invoices could claim the same wallet by locking on the amount range instead of checking first and locking after.
- Ran the migration to a new wallet provider and wrote our own REST client for it rather than using their SDK, so their real error message reached us instead of a generic failure. Tracked down a production signing failure on it end to end and shipped the fix, including a check that refuses to send a transaction when the signature does not verify.
- Wired identity verification (KYC) into the flow so compliance was part of the product rather than bolted on afterwards.

ION Feb 2020 - Dec 2024

Full Stack Software Engineer (fully remote, 5 years)

ConnectX (Jan 2023 - Dec 2024, team of 10), a multi-tenant rebuild of a work management platform. Connection (Feb 2020 - Dec 2022, team of 12), the internal version of it.

- Worked on the multi-tenant rebuild, where each company registers and manages its own users, with permissions layered at three levels: the app, the company, and the individual user.
- Built praise, skills and leaderboard features: praise connected to department and division data, skill scores aggregated per person, and skills linked to praise so people could be matched by what they were actually recognised for.
- Built a people search that takes plain English. Type something like "who excels in web design with Framer and Base44 in London" and it returns results ranked by how well they match.
- Improved time off and project timelines: made bulk approvals simple, and taught the timeline about public holidays and each person's working days so plans matched reality.
- Steadied form behaviour and validation across the app, and maintained a large legacy codebase for five years. Also built an integration that syncs employee data from an HRIS so nobody keyed it in twice.

Full Stack Web Developer

Team of 15.

- Built the CG Voucher Generator, an internal web app that generates voucher codes for affiliate partners, tracks their status and produces reports. Before it, vouchers came from providers and lived in separate spreadsheets that nobody could see the status of.
- Built several dashboards to answer questions the business kept asking by hand.

THINGS I HAVE BUILT

Backoffice Dashboard TypeScript

The admin and customer side of a payments platform: transactions, invoicing and identity checks, built in React and Next.js against the NestJS APIs I wrote underneath.

TypeScript, React, Next.js, NestJS, PostgreSQL, REST

Data Indexing Service Go

Keeps the backend in step with what happened on-chain. Live scanning for new activity, a backfill mode that catches up after an outage, cleanup jobs so the database does not grow forever, and deduplication so nothing is counted twice.

Go, PostgreSQL, Redis, webhooks

EDU Chain Hackathon, DeFi Track 3rd place

Third place in the DeFi track (May 2025), building and demoing a working project inside a fixed hackathon window. Good practice at deciding what not to build.

Web3 tooling, rapid prototyping

EDUCATION

B.S. Geophysical Engineering

Aug 2011 - Sep 2015

Bandung Institute of Technology

JavaScript Fullstack Immersive Program

Nov 2018

Hacktiv8

CERTIFICATIONS

AWS Certified Cloud Practitioner

Sep 2024

Amazon Web Services

TOOLS I USE

Languages: TypeScript, JavaScript (8 yrs), SQL, Go, Python (basic) Frontend: React.js, Next.js, Angular, Vue

Backend: Node.js, NestJS, REST APIs, webhooks, background workers and queues

Databases: PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch, Neo4j

Cloud & DevOps: AWS (Certified Cloud Practitioner), Docker, GitHub Actions CI/CD, Ansible, Grafana

Testing: Playwright (3+ yrs), Selenium, Mocha AI: Claude daily for planning, drafting and implementation

Spoken: English (Professional, IELTS 7.5), Korean (Conversational), Indonesian (Native)
